MI449 Final Project

Takehome

This project, made using React Bootstrap, utilizes two public APIs, GamerPower and Free-to-Play Games Database. The site aims to give users a one-stop shop experience where they can see all free games available to download, and also access all live videogame giveaways. A simplistic approach to site design allows users to focus on the content rather than the site itself. The inviting color palette entices users to explore their options and come back for more. A user is able to sort the table listings easily. They can sort by Platform, Genre, Type, Value, Relevance, Title, Release, and End Date. The separately colored Platform and Genre/Type buttons show the user that they act a bit differently than the other sorting mechanisms. The Platform and Genre/Type buttons reduce the listed games to just those of the desired option, whereas the other sorting options simply reorder the existing list of games.
